# $PAPER — Value-Capture & Utility Token

**Converting global trade volume into permanent token scarcity**

## Opportunity (Token-Level)

### The Opportunity for $PAPER

Most crypto tokens fail because:

- They rely on emissions for demand
- Usage is optional, not enforced
- Value is narrative-driven, not cashflow-driven

Meanwhile, **global trade finance moves trillions of dollars annually**, almost entirely off-chain, with fees captured by slow, manual intermediaries.

**Paperless brings this volume on-chain.**
**$PAPER is the mechanism that captures the value of that flow.**

As trade volume migrates onto the protocol, fees scale automatically — creating sustained demand for the token.

Every invoice financed and every loan repaid **increases demand for $PAPER**.

## Unfair Advantage (Why This Token Wins)

### Structural Advantages of $PAPER

$PAPER is not a generic utility token. It has **non-optional demand** and **one-way supply mechanics**.

**Unfair advantages:**

- **Mandatory fee settlement**
  All protocol activity routes fees through $PAPER mechanics
- **Real revenue source**
  Fees come from invoice repayments, not token issuance
- **Automatic buy & burn**
  Revenue is converted into permanent supply reduction
- **No inflationary emissions**
  Staking rewards are funded by real cashflows
- **Flow-based scaling**
  Demand scales with transaction volume, not speculation

Most tokens ask users to buy them.
**$PAPER is bought by the protocol itself, continuously.**

---

# How $PAPER Captures Value

## Mandatory Fee Routing

All Paperless protocol activity generates fees:

- Credit origination
- Repayments & servicing
- Capital recycling
- Vault rebalancing

Fees are paid in USDC but **settled through $PAPER mechanics**.
No $PAPER → no protocol scale.

---

## Revenue → Buy → Burn

Paperless does not accumulate revenue.

On every repayment:

1. Fees collected (USDC)
2. $PAPER bought on the open market
3. Tokens burned permanently

**Result:**
More usage → more buy pressure → less supply.

Business growth is mathematically linked to token scarcity.

---

## Staking & Yield

$PAPER can be staked to:

- Support protocol liquidity
- Back trade finance vaults
- Reduce circulating supply

**Rewards paid in:**

- USDC (real trade repayments)
- $PAPER (aligned upside)

No inflationary emissions.

---

## Optional Extension (Roadmap)

Staked $PAPER can be wrapped (wPAPER) and deployed into AI-underwritten trade deals, earning yield from **real invoice cashflows**, not token issuance.

(v2 feature — not required at launch)

---

## Why This Scales

Paperless monetises **flow, not balance sheets**.

- 1 invoice → 1 fee
- Millions of invoices → continuous market buys

As Paperless becomes the transaction rail for global trade credit, $PAPER becomes increasingly scarce by design.

---

## Market Size = Token Demand

- **$27T** global trade finance market
- **$3.5T** rejected annually
- Paperless targets unfinanced flow

Every dollar routed through the protocol increases fees, burns, and long-term $PAPER scarcity.

---

## The Flywheel

More Trade → More Fees → Buy & Burn
Burns + Staking → Less Supply → Higher Token Value

**One token. One revenue engine. Real volume.**

---

### Final positioning line

> **$PAPER is a value-capture & utility token that converts global trade volume into permanent token scarcity.**

| Detail | Specification |
|---|---|
| **Chain** | Base |
| **Ticker** | **$PAPER** |
| **Max Supply** | **1,000,000,000** |
| **Token Type** | Value-capture & utility token |
| **Core Uses** | Fee settlement, staking, supply reduction (burn engine) |

Tokenomics & Key Rounds

| Round | Price | Raise | FDV | Notes |
|---|---|---|---|---|
| **Private** | | $500k | | Equity |
| **Presale 1** | $0.03 | $1m | $30M | Private |
| **VC Round** | $0.04 | $4m | $40M | Equity/Tokens |
| **Presale 2** | $0.05 | $2m | $50M | Private |
| **Launchpad** | $0.06 | $10m | $60M | Public |
| **TGE** | $0.08 | | $80M | CEX / DEX |

Allocation & Vesting

| Allocation | % Supply | Vesting |
|---|---|---|
| **Private Sales** | 15% | 6m cliff → 12m linear |
| **Public Sale** | 15% | 3m cliff → 15m linear |
| **Liquidity (DEX + CEX)** | 20% | 6m linear |
| **Protocol Treasury** | 20% | Locked, deployed by protocol |
| **Team & Advisors** | 10% | 12m cliff → 36m linear |
| **Ecosystem & Rewards** | 10% | Linear over 5 years |

## V. Next Steps & Call to Action (CTA)

Private sales purchases can be made at sale page

To begin implementation, we propose a kick-off meeting on Date. Please confirm your attendance at the project kickoff by reserving your spot: Calendar event

The full set of documents can be reviewed in our gitbook
