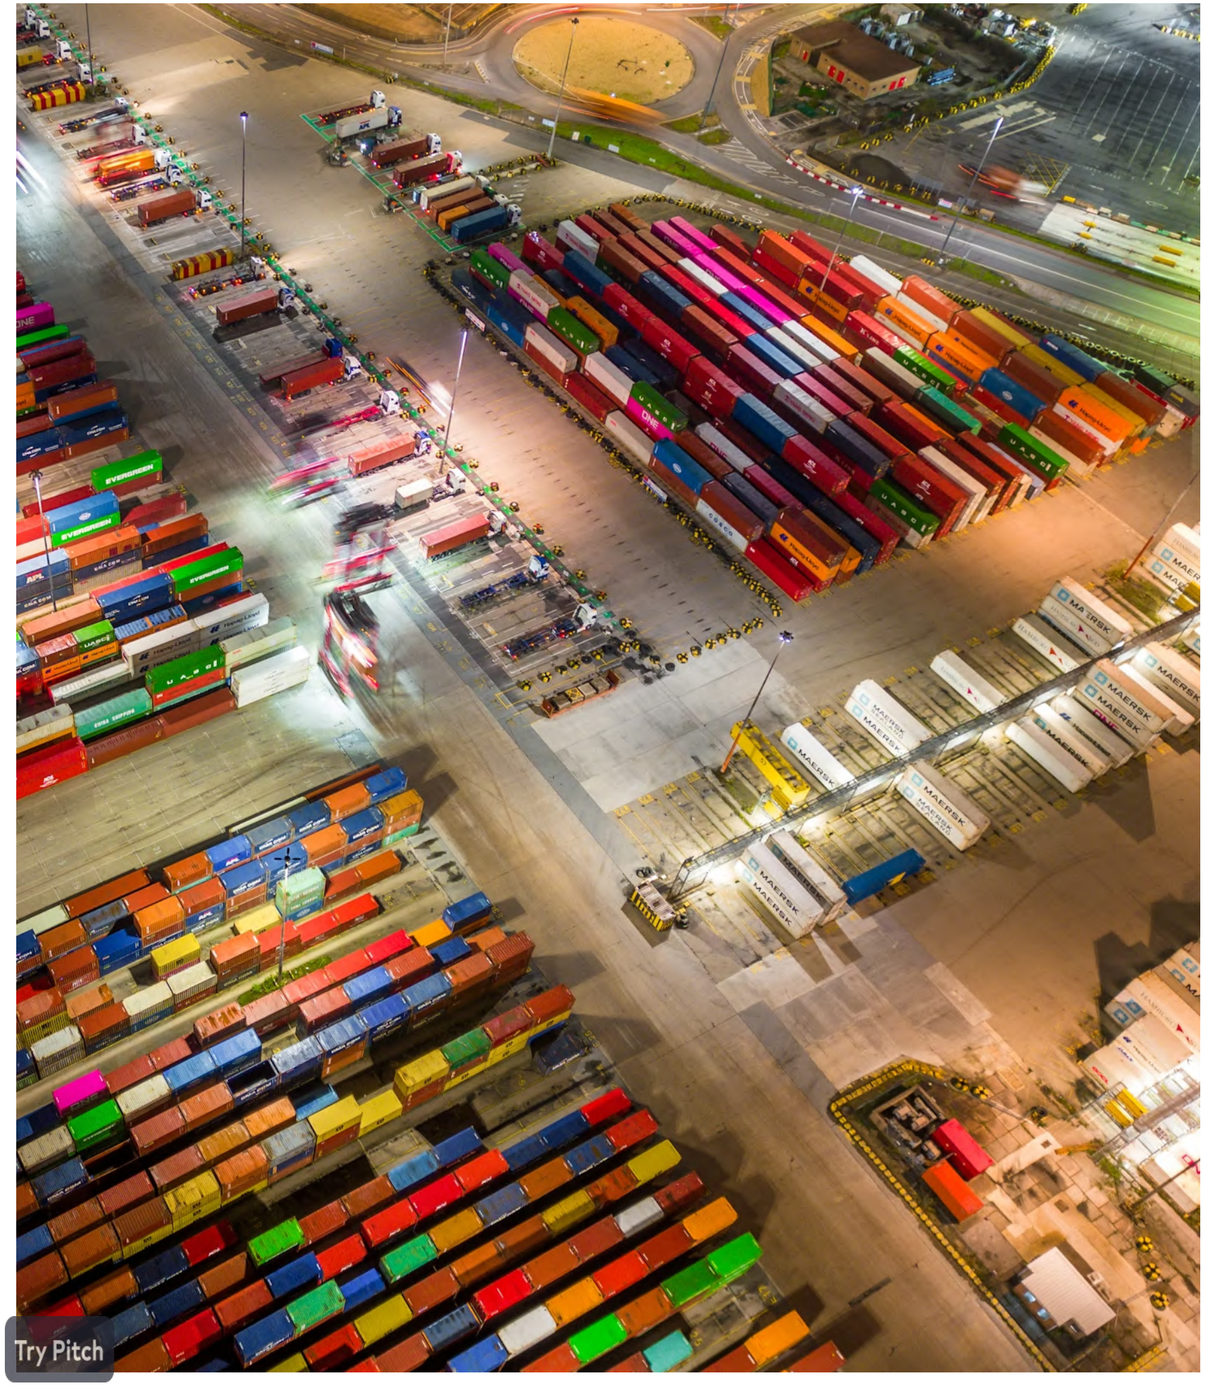
TradFi doesn't scale.
So we built the layer to fix it.

Automate the tedious. Prioritise flow, without scaling cost...

Try Pitch



paperless

RWA Market Opportunity

- $27T trade finance dealflow
- $3–3.5T global trade finance gap
- SMEs systematically excluded
- Institutional Capital sitting idle
- $300b Stablecoins

It's a **dealflow processing opportunity**...

Try Pitch

Problem

paperless

Trade Finance doesnt scale and is a system stuck in the 1980s...

Capital isn't scarce. Deals aren't scarce. Processing dealflow is the bottleneck.

Traditional Finance

Capital ⟶ Humans ⟶ Paper ⟶ Sequential checks ⟶ Few large deals

- Processing cost per deal: high
- Time per deal: weeks
- Result: 1 × $100m deal

- Dealflow is capped
- Banks reject viable trades
- Capital sits idle
- SMEs wait weeks for funding
- More capital does not increase throughput

Try Pitch

Solution

paperless

We have built the MLETR compliant layer to scale legal off chain assets on chain with Ai agents and programable assets and capital to automate dealflow.

Capital ⟶ Paperless engine ⟶ Programmable assets + agents ⟶ Continuous settlement

- Processing cost per deal: ~zero marginal
- Time per deal: minutes
- Result: 1,000 × $1m deals

Same capital. 1000x throughput. Lower risk.

Tokenised Programable TradFi acts like DeFi and profits like exchanges and payment rails...

Try Pitch

What we do…

Banks ask:

“Is this company financeable?”

Paperless asks:

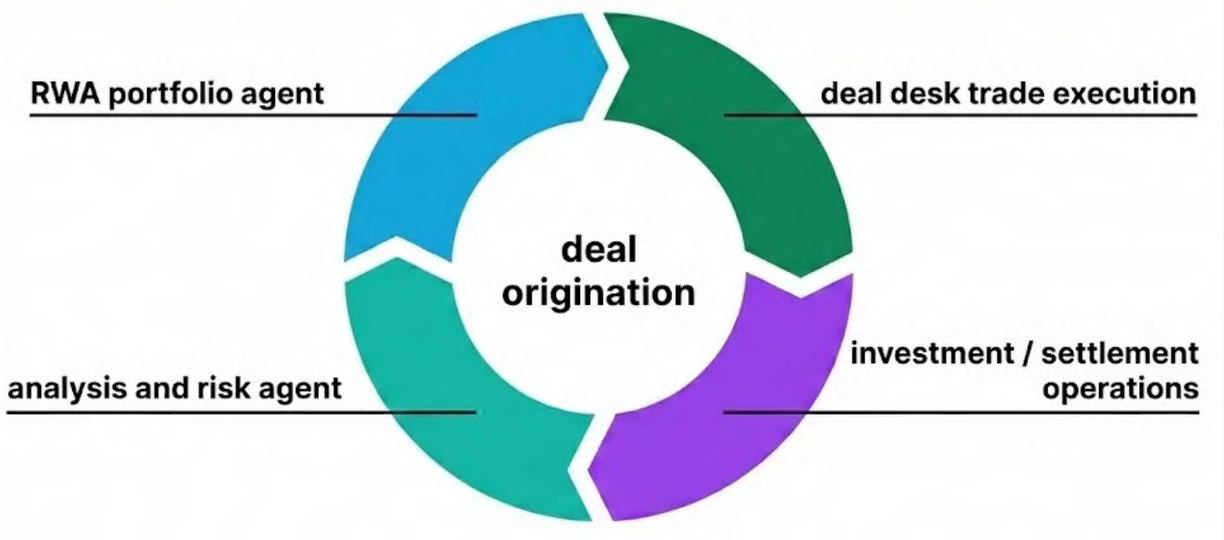
“Is this transaction financeable?”

That shift only works if processing is automated.

Most trade finance deals are rejected not for risk — but because they’re too small to process.

Paperless:

- Makes small, frequent deals economical
- Turns flows into first-class financial objects
- Lets capital recycle continuously instead of waiting



Try Pitch

Yield bearing Stable coin for digital supplychains

- paperUSD Stablecoin = scalable yield bearing capital
- Invoice NFTs = scalable tokenised security + compliance + de risking
- Paperless Ai = scalable intake + processing + settlement
- $PAPER = scaleable DAO

- Programable capital + programable securites
- High Yield that scales with short duration dealflow
- Self-liquidating, recirculating trade activity
- Autonomous dealflow increases compounded yield
- Unlocks new financial products

Paperless is the layer for all supply chain and the yield engine for crypto + RWAs

Why Now...

Whats Changed

- Tokenisation
- Digital trade data can now be created at the source
- AI Models
- Digital programable Capital
- Instant settlement rails
- Capital demands faster, de risked, higher yields
- MLETR/ETDA Regulations + Compliance for RWAs and Digital Assets

For the first time, trade can scale into financial networks.
The constraint has shifted from regulation and capital to **processing throughput**.

Now is when trade finance becomes infrastructure.

paperless

Revenue Model

Paperless monetizes trade the way payment solutions and exchanges monetize by scale, with simple Transaction Based Revenue Model on **every high-value event in the trade finance lifecycle.**

- Tokenisation
- Ai Deal Processing
- Capital movement
- NAV
- Settlement

As trade volume scales, revenue scales automatically.
Clean simple with a focus on client acquisition and churn reduction.
